USE ONLY FOR FILING A PROVISIONAL APPLICATION FOR PATENT

This collection of information is required by 37 CFR 1.51. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.11 and 1.14. This collection is estimated to take 10 hours to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.

PROVISIONAL APPLICATION FOR PATENT COVER SHEET – Page 2 of 2

The invention was made by an agency of the United States Government or under a contract with an agency of the United States Government. (NOTE: Providing this information on a provisional cover sheet, such as this Provisional Application for Patent Cover Sheet (Form PTO/SB/16), does not satisfy the requirement of 35 U.S.C. 202(c)(6), which requires that the *specification* contain a statement specifying that the invention was made with Government support and that the Government has certain rights in the invention.)

No.

Yes, the invention was made by an agency of the U.S. Government. The U.S. Government agency name is:

Yes, the invention was made under a contract with an agency of the U.S. Government.

The contract number is: _____

The U.S. Government agency name is: _____

In accordance with 35 U.S.C. 202(c)(6) and 37 CFR 401.14(f)(4), the specifications of any United States patent applications and any patent issuing thereon covering the invention, including the enclosed provisional application, must state the following:

“This invention was made with government support under [IDENTIFY THE CONTRACT] awarded by [IDENTIFY THE FEDERAL AGENCY]. The government has certain rights in the invention.”

WARNING:

Petitioner/applicant is cautioned to avoid submitting personal information in documents filed in a patent application that may contribute to identity theft. Personal information such as social security numbers, bank account numbers, or credit card numbers (other than a check or credit card authorization form PTO-2038 submitted for payment purposes) is never required by the USPTO to support a petition or an application. If this type of personal information is included in documents submitted to the USPTO, petitioners/applicants should consider redacting such personal information from the documents before submitting them to the USPTO. Petitioner/applicant is advised that the record of a patent application is available to the public after publication of the application (unless a non-publication request in compliance with 37 CFR 1.213(a) is made in the application) or issuance of a patent. Furthermore, the record from an abandoned application may also be available to the public if the application is referenced in a published application or an issued patent (see 37 CFR 1.14). Checks and credit card authorization forms PTO-2038 submitted for payment purposes are not retained in the application file and therefore are not publicly available.

 TELEPHONE 412-471-8815 DOCKET NUMBER 6178-1908689

Privacy Act Statement

The **Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (*i.e.*, GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it contains a valid OMB control number.

Filing By Reference:

Only complete this section when filing an application by reference under 35 U.S.C. 111(c) and 37 CFR 1.57(a). Do not complete this section if application papers including a specification and any drawings are being filed. Any domestic benefit or foreign priority information must be provided in the appropriate section(s) below (i.e., "Domestic Benefit/National Stage Information" and "Foreign Priority Information").

For the purposes of a filing date under 37 CFR 1.53(b), the description and any drawings of the present application are replaced by this reference to the previously filed application, subject to conditions and requirements of 37 CFR 1.57(a).

Publication Information:

☐ Request Early Publication (Fee required at time of Request 37 CFR 1.219)

☐ **Request Not to Publish.** I hereby request that the attached application not be published under 35 U.S.C. 122(b) and certify that the invention disclosed in the attached application **has not and will not** be the subject of an application filed in another country, or under a multilateral international agreement, that requires publication at eighteen months after filing.

Representative Information:

Representative information should be provided for all practitioners having a power of attorney in the application. Providing this information in the Application Data Sheet does not constitute a power of attorney in the application (see 37 CFR 1.32). Either enter Customer Number or complete the Representative Name section below. If both sections are completed the customer Number will be used for the Representative Information during processing.

Foreign Priority Information:

This section allows for the applicant to claim priority to a foreign application. Providing this information in the application data sheet constitutes the claim for priority as required by 35 U.S.C. 119(b) and 37 CFR 1.55. When priority is claimed to a foreign application that is eligible for retrieval under the priority document exchange program (PDX)ⁱ the information will be used by the Office to automatically attempt retrieval pursuant to 37 CFR 1.55(i)(1) and (2). Under the PDX program, applicant bears the ultimate responsibility for ensuring that a copy of the foreign application is received by the Office from the participating foreign intellectual property office, or a certified copy of the foreign priority application is filed, within the time period specified in 37 CFR 1.55(g)(1).

Authorization or Opt-Out of Authorization to Permit Access:

When this Application Data Sheet is properly signed and filed with the application, applicant has provided written authority to permit a participating foreign intellectual property (IP) office access to the instant application-as-filed (see paragraph A in subsection 1 below) and the European Patent Office (EPO) access to any search results from the instant application (see paragraph B in subsection 1 below).

Should applicant choose not to provide an authorization identified in subsection 1 below, applicant **must opt-out** of the authorization by checking the corresponding box A or B or both in subsection 2 below.

NOTE: This section of the Application Data Sheet is **ONLY** reviewed and processed with the **INITIAL** filing of an application. After the initial filing of an application, an Application Data Sheet cannot be used to provide or rescind authorization for access by a foreign IP office(s). Instead, Form PTO/SB/39 or PTO/SB/69 must be used as appropriate.

1. Authorization to Permit Access by a Foreign Intellectual Property Office(s)

A. Priority Document Exchange (PDX) - Unless box A in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the European Patent Office (EPO), the Japan Patent Office (JPO), the Korean Intellectual Property Office (KIPO), the State Intellectual Property Office of the People's Republic of China (SIPO), the World Intellectual Property Organization (WIPO), and any other foreign intellectual property office participating with the USPTO in a bilateral or multilateral priority document exchange agreement in which a foreign application claiming priority to the instant patent application is filed, access to: (1) the instant patent application-as-filed and its related bibliographic data, (2) any foreign or domestic application to which priority or benefit is claimed by the instant application and its related bibliographic data, and (3) the date of filing of this Authorization. See 37 CFR 1.14(h)(1).

B. Search Results from U.S. Application to EPO - Unless box B in subsection 2 (opt-out of authorization) is checked, the undersigned hereby **grants the USPTO authority** to provide the EPO access to the bibliographic data and search results from the instant patent application when a European patent application claiming priority to the instant patent application is filed. See 37 CFR 1.14(h)(2).

The applicant is reminded that the EPO's Rule 141(1) EPC (European Patent Convention) requires applicants to submit a copy of search results from the instant application without delay in a European patent application that claims priority to the instant application.

2. Opt-Out of Authorizations to Permit Access by a Foreign Intellectual Property Office(s)

☐ A. Applicant **DOES NOT** authorize the USPTO to permit a participating foreign IP office access to the instant application-as-filed. If this box is checked, the USPTO will not be providing a participating foreign IP office with any documents and information identified in subsection 1A above.

☐ B. Applicant **DOES NOT** authorize the USPTO to transmit to the EPO any search results from the instant patent application. If this box is checked, the USPTO will not be providing the EPO with search results from the instant application.

NOTE: Once the application has published or is otherwise publicly available, the USPTO may provide access to the application in accordance with 37 CFR 1.14.

Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

- 1 The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
- 2 A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
- 3 A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
- 4 A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
- 5 A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
- 6 A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
- 7 A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
- 8 A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
- 9 A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

METHOD AND CONDENSING HEAT EXCHANGER FOR AIR TO LIQUID HEAT PUMPS

FIELD OF THE INVENTION

An improved condensing heat exchanger for use in air source to liquid heat pumps, such as a swimming pool heat pump or liquid to liquid heat pumps and other applications.

BACKGROUND OF THE INVENTION

Air source heat pumps have been used in various applications to remove heat from outdoor air and move it to another fluid or heat sink for space and water heating as well as other applications, including process heat for industrial and commercial applications including agricultural aquariums, fish ponds, etc.

Heat pumps are increasingly replacing fossil fuel heaters, especially where they are already the most cost effective heating method, where the cost per delivered Btu is greater than the cost of the electricity required to move a Btu of heat from the air using a heat pump.

One such application, swimming pool heat pumps, have been manufactured for over 50 years. In the past, due to their unfamiliarity and higher initial cost, they have been overlooked by many pool owners.

In the last few decades, however, swimming pool heat pumps have become increasingly popular as a more efficient and cost effective alternative to fossil fuel pool heaters, such as natural gas, propane and oil fired units, due to their significant operating cost savings, which quickly offset the higher initial cost of swimming pool heat pumps.

It is not uncommon for a swimming pool heat pump to have a payback period of one or two seasons.

As a result, all major fossil fuel pool heater manufacturers now also make and sell heat pump models. However, due to the higher initial cost and recent drops in the prices of fossil fuels resulting from fracking, fossil fuel pool heaters still have the larger market share.

The higher cost of a swimming pool heat pump compared to a fossil fuel pool heater is due to the additional fan motor and air moving components, the refrigeration system piping, and the compressor. In addition, cost is increased by the need for two heat exchangers, namely, an evaporator for removing heat from the air to cooler low pressure evaporating refrigerant and a condenser for transferring that heat from the hotter compressed high pressure refrigerant gas to the swimming pool or spa water.

The first swimming pool heat pumps in the 1980s originally adopted two of the controls as well as the heat exchanger tube material used by the fossil fuel pool heater:

1. A water pressure switch to detect water flow by sensing the back pressure the pump creates as water is pumped through an eyeball fitting in a return line back to the pool.

2. A mechanical thermostat to monitor water temperature which uses a copper bulb in a well, and a capillary tube connected to a diaphragm, to actuate a micro-switch.
3. Copper and later Cupronickel heat exchanger material, until chlorinated water corrosion caused leaks, which ruined the heat pump systems. Then Cupronickel, as well as some coatings, were tried to stop corrosion. Titanium was first adopted by the Heat Siphon brand swimming pool heat pumps in 1991 to solve this problem.

Current Heat Exchangers in Swimming Pool Heat Pumps

Controls - Modern swimming pool heat pumps and many gas heaters now use an electronic controller which is more reliable and allows less expensive, and simpler thermistors to monitor water temperature.

Heat Exchanger Tube Material - Swimming pool heat pumps almost all have adopted the use of titanium tubing in the water side heat exchanger, and all use either a titanium spiral tube inside a plastic tube, or a titanium tube helical coil inside a plastic shell.

The following are images of the heat exchangers in current swimming pool heat pumps, which are either tube in shell or tube in tube:

The titanium tubes in tube and shell type heat exchangers are estimated to be 30 to 80 feet in length, with spiral tube in tube types having about the same equivalent length since a smooth tube is twisted in a spiral significantly shortening it. Water flows over the titanium tube and refrigerant flows inside.

The Heat Siphon brand uses a helical coil some 50 feet long inside a PVC shell in its 50,000 btuh model and 75 feet long in larger models.

The tube in shell heat exchangers use some type of baffle to increase velocity to improve efficiency.

AQUACAL

The tube in tube heat exchangers use a spiral tube inside a smooth PVC pipe jacket coiled in a tight helix to conserve space, however the length of starting titanium tube is still two to three times the final twisted length.

SUMMARY OF THE INVENTION

This invention is an improvement on the current art both in its efficiency as well as the reduced cost to manufacture.

Very shallow dimples are made in the outer titanium tube so they touch the inner tube. They are made in pairs at 90 degree angles, with four dimples in one circle, and each set is alternately rotated 45 degrees, making a total of eight rows axially down the tubes length.

The result is a micro channel of typically .035 inches wide with the dimples holding the inner tube in the center of the outer tube and allowing the pair of tubes to be coiled and assembled inside.

This results in:

1. Very little shortening of the outer tube thus much less length of tubing required
2. Increased heat transfer due to the micro channel gap which further shortens the length of tube required
3. Increased heat transfer due to the heated fluid being in direct contact with the inner and outer tubes in a single pass which further reduces tube length needed.

The first test of this invention confirmed that the smallest Heat Siphon model, which has an output of approximately 50,000 btuh, and which has a tube in shell type heat exchanger and two helically wound tube coils, uses 35 feet of titanium tubing, when equipped with the tube in tube dimpled heat exchanger invention only required ten feet total inner plus outer tube to achieve same heat output and at an efficiency slightly greater. This saves 25 feet of titanium tubing and increased the efficiency of the model.

BRIEF DESCRIPTION OF THE DRAWINGS

Throughout this application, parts, and descriptions refer to the Figures appended hereto, and the part numbers and names refer to the item numbers in the referenced Figures.

DESCRIPTION OF THE INVENTION

The term “water” and “heated fluid” are interchangeable throughout this description where water is used in conjunction with swimming pool heat pump applications for clarity while heated fluid is the more accurate to all other applications.

For a fuller understanding of the nature of the present invention, reference should be had to the following detailed description taken in connection with the accompanying drawings of one or more preferred embodiments of the invention:

Figure 1 shows the invention 200 where the preferred embodiment is assembled and installed in a heated fluid piping system and in the refrigeration tubing of a typical air source to liquid heat pump 100. A heat pump's refrigeration circuit must include four components to work as shown by Figure 1:

1. an air moving device 101 and an evaporating heat exchanger 102 to extract heat from the air
2. a refrigerant compressor 103 to compress and thereby heat up the refrigerant gas
3. a condensing heat exchanger 104 to deliver the heat to the water which passes to it from the pool at 105 and returns to the pool at 106 via the filter pump circulation plumbing
4. a metering expansion device 107 between the two heat exchangers to create a high pressure zone for condensing the hot compressed refrigerant gas, and low pressure side to evaporate the cool liquid refrigerant.

In addition, Figure 1 shows the installation of two isolation fittings 54, the subject of patent 9,255,656 (attached hereto as Appendix A), which as mentioned later herein, will allow repair or replacement of the heat exchanger invention without cutting tubes or brazing or welding by simply unscrewing the fittings.

Figure 2 shows the invention heat exchanger assembly 200, which consists of a flexible schedule 40 PVC pipe 20 of a length and straight or curved to accommodate the required length of heat exchanger, which is typically solvent welded (glued) to the 1.0 inch x 1.5 inch x 1.5 inch PVC sch 40 tees 22 at each end. A PVC bushing 23 is glued into the 1 inch port of the tee and a fitting

nut 24 screws into the bushing 23 and squeezes a suitable rubber rectangular or o-ring (not visible) against the titanium pressure relief tube 25 to seal and prevent the heated fluid inside the heat exchanger from leaking out. Inside the relief tube 25, is a smaller diameter titanium refrigerant inlet tube 26 or outlet tube 27 depending on which end of the heat exchanger, one is referring. External swimming pool piping 21 is shown in place.

Figure 3 shows the internal titanium tube assembly 46 which has identical tubes and fittings at each end inside each PVC tee 22.

These assemblies are composed of the refrigerant inlet tube 26 and outlet tube 27, which protrude inside the pressure relief tubes 25, that are orbital welded to the titanium pressure relief tube weld fittings 31.

As shown in figure 3, these fittings 31, screw into the titanium water seal weld fittings 30. The titanium water seal weld fittings 30, are welded into the titanium annulus tee 32, which is in turn orbital welded to the inner annulus titanium tube 29, and the outer titanium dimpled tube 28.

Figure 4 is a sectional view of one end of the heat exchanger assembly 200, and shows the water 41, and refrigerant 38, flow channels, the pressure relief flow channel 53, and the various internal tubes, seals, weld beads, and fittings.

Figure 4 also delineates an enlarged view shown by Figure 16 to provide a more detailed clear view of the parts and the flow paths of the water and refrigerant. Figure 17 is a sectional view of the annulus tee 32 and more clearly shows the details of its cavity and how the dimple tubes 28 and 29 fit.

Water Flow Path

Figure 4 shows the outer PVC tee 22 which directs the water at 41, both around the titanium tube assembly 46 as well as through the inner titanium tube 29. In more detail, the water flows over titanium annulus tee 32, over all of the numerous dimple tube depressions 37, made in the outer tube 28 which should disrupt any laminar flow and cause turbulence enhancing the heat transfer between the hotter titanium tubes and the water.

At the other end of the assembly, the tee 22 gathers the heated water from these two flow paths and returns it to the pool. This doubles the surface area transferring heat from the refrigerant to the water over the length of the heat exchanger since both the inside of the inner tube 29 and outside diameter of the dimpled tube 28 are in direct contact with the pool water 41.

Refrigerant Flow Path

As shown in figure 4 the refrigerant flow path 38, enters the titanium inlet tube 26 which is welded by the weld bead 44 to the tube fitting 33, which is threaded into the titanium water seal fitting 30, and flows into the annulus tee 32.

The titanium weld 43 joins the titanium annulus tee 32 to the titanium water seal fitting 30, separating the heated fluid and refrigerant, thus the refrigerant path continues into the annulus formed by the inner titanium tube 29 and the outer titanium dimpled tube 28.

The refrigerant is prevented from leaking out to the pressure relief tube 25 annulus by the o-ring 34.

As figure 4 shows, through a combination of o-rings and titanium welds, that the flow path of the heated fluid and the refrigerant are kept separated and a leak path is provided such that if either o-ring is breached the refrigerant or the heated fluid will weep out of the pressure relief tube to atmosphere instead of possibly contaminating the heat pump refrigerant system.

The seal points are as follows:

1. Orbital weld 44 seals the titanium inlet tube 26 to the titanium refrigerant weld fitting 33.
2. O-ring 34 seals the titanium refrigerant weld fitting 33 and the titanium water seal weld fitting 30.
3. Weld 43 seals the titanium water seal weld fitting 30 to the titanium annulus tee 32.
4. Orbital weld 42 seals the titanium outer dimple tube 28 to the titanium annulus tee 32 on each end of the heat exchanger.
5. Orbital weld 39 seals the titanium inner annulus tube 29 to the titanium annulus tee 32 on each end of the heat exchanger.

Thus items 1-5 above establish the flow path for the refrigerant sealed from the heated fluid.

6. Orbital weld 45 seals the titanium pressure relief tube 25 to the titanium pressure relief weld fitting 31.
7. O-ring 35 seals the titanium pressure relief weld fitting 31 and titanium refrigerant weld fitting 33 from the heated fluid.
8. O-ring / Seal Ring 36 compressed by PVC nut 24 and PVC bushing 23 which squeeze the seal against the pressure relief tube 25, and seals the heated fluid in tee 22.
9. O-ring 34 also seals any heated fluid which may have leaked from O-ring 35 from entering the refrigerant system which leaves an open path for any such leak to escape down the pressure relief tube open to atmosphere.

Figure 5 shows a sectional view of the welded titanium annulus tee assembly 40 consisting of the annulus tee 32 and the outer and inner dimple tubes 28 and 29 sealed by orbital welds 39 and 42 respectively to it, and the titanium water seal 30, welded to it also by weld 43 with the water seal o-ring 35, in place.

Figure 5 also shows the heated fluid flow path 41 and the refrigerant flow path 38.

Figure 6 is a sectional view of welded pressure relief tube fitting assembly 47 showing the fitting 31 and pressure relief tube 25 welded together by orbital weld bead 45.

Figure 7 is a sectional view of the welded titanium inlet tube & fitting assembly 48, consisting of inlet tube 26 and fitting 33 welded by orbital weld bead 44.

In order for the welded annulus tee assembly 40 to fit in the PVC tee 22, it is necessary for the tubes 28 & 29, tee 32 and fitting 30 to be all welded together and inserted into the PVC tee 22's 1.5 inch port and flexible tube 20 prior to screwing in the welded inlet tube & fitting assembly 48 shown in Figure 7 and the welded pressure relief tube fitting assembly 47 shown in figure 6.

Figure 7 also shows the heated fluid flow path 41 and the refrigerant flow path 38.

Figure 8 is an exploded view of the internal titanium tube assembly 46, showing the outer dimple tube 28 and inner tube 29, annulus tee 32, water seal weld fitting 30, pressure relief o-ring 35, refrigerant o-ring seal 34, refrigerant weld fitting 33, pressure relief fitting 31, pressure relief tube 25 and refrigerant inlet fitting 26.

Figure 9 is a sectional view of fitting 33.

Figure 10 is a sectional view of fitting 31.

Figure 11 is a sectional view of fitting 30.

Figure 12 is a frontal view of Figure 13 the outer dimple tube and inner tube assembled together. Figure 12 shows the locations of the dimples and how they capture the inner tube and provide the annulus micro channel for the refrigerant to flow and condense.

Figure 14 shows the outer dimpled tube 28 and the inner tube 29 bent into a curve after assembling together.

Figure 15 shows the complete heat exchanger 201 in the preferred embodiment with inlet and outlet tube 27 and 26, pressure relief tube 25, PVC nut 24 and bushing fitting 25, PVC tee 22, and inside the tee the welded annulus tee assembly.

Figure 16 is an enlarged view of the area delineated by the dashed circle in sectional view of figure 3 to more clearly show the water and refrigerant flow paths 38 and 41, and the various seals, fittings and tubes. At the top is a partial view of the PVC tee 22. The annulus tee 32, the two orbital weld beads 39 and 42 which seal and attach the outer dimple tube 28 and inner annulus tube 29 to the annulus tee 32 are shown clearly.

Below those, the titanium water seal fitting 30 has its pressure relief o-ring seal 35 in place and is attached to the annulus tee 32 by weld 43.

The pressure relief weld fitting is partially shown assembled in place threaded on to the end of titanium water seal fitting 30.

Also shown are the titanium weld fitting 33 with its refrigerant o-ring 34 in place, threaded into the water seal fitting 30. Attached to this fitting by orbital weld beads 44 is the titanium inlet tube 26.

Figure 17 is a sectional view showing the titanium annulus tee 32 with the annulus surface 49 that allows the refrigerant to flow from the inlet tube into the tee and around the inner tube 29 then continues between the outside diameter of the inner tube and the inside diameter of the outer dimple tube 28 both shown in figure 16.

Figure 17 also shows the mating surfaces of the two tubes and one fitting that are seal welded to the tee. Surface 50 mates with and is seal welded to the inner tube 29.

Surface 51 mates with and is seal welded to the outer dimple tube 28. Surface 52 is the ledge stop for the titanium water seal weld fitting 30 as it is inserted into the annulus tee 32 and seal welded 43 to it.

Figure 18 shows a wheel 108 used in the device shown in figure 19 to put the dimples into the outer tube. The wheel is machined to fit around the OD of the outer tube 180 degrees and has three spherical projections 109 affixed to the center of the inside radius 120 degree apart.

Figure 19 is a sectional view of such a device where two wheels 108 are placed on two shafts 111 which are inserted into two end blocks 110 to fix the distance between the wheels so they touch. One could add bearings and various mechanisms to pull the outer tube through the wheels to form the dimples in the tube.

The function of this invention for a swimming pool heat pump and other applications is to provide an improved heat exchanger that uses half or less titanium than the current art by improving heat transfer efficiency while maintaining a low water pressure drop.

The following details of the invention are important to its successful implementation.

1. The .035 inch wide annulus formed by the outside diameter of the inner titanium 1/2 inch tube 29 and the inside diameter of the outer tube 28 which is 5/8 inch OD x .028 inch wall is optimal for rapid micro channel condensing of the hot refrigerant gas and greatly increases the btuh heat transfer rate per unit length over the existing spiral tube heat exchangers as well as tube coil in shell heat exchangers.

2. In order to assemble the heat exchanger in a standard PVC tee and flexible pipe, it is preferred to use a two piece approach. This provides a solution by creating the titanium annulus fitting assembly 40 as shown in figure 5 which is inserted in the tee 22. Then, the welded titanium inlet/outlet tube & fitting assembly 48 shown in figure 7, is threaded into the titanium water seal fitting 30 through the 1 inch port of the tee 22, followed by the welded pressure relief fitting 47 shown in figure 6, which is threaded onto the threads on the OD of the titanium water seal fitting 30.

3. In this invention dependable and long life water and refrigerant seals are both made by seal welding various parts together and the use of o-rings of viton or other rubber material compatible with the liquid being heated by the heat pump in those applications.

4. By using standard PVC fittings and pipes and titanium tubes readily available, as titanium has continued to drop in price as it has been adopted in many industries, this invention will result a lower cost heat exchanger.
5. By using only titanium and PVC and a suitable o-ring seal material, the heat exchanger is more broadly applicable to the heating of many other corrosive liquids than swimming pool water which further reduces cost by increasing the number and volume of its uses.
6. The use of staggered dimples in the outer tube 28 by this invention as shown in figures 12, 13 and 14 and which are easily made by the method and devices similar to that shown by figures 18 and 19, maintains the close annulus spacing, keeps the tubes centered about each other and allows the modest bending into a coiled housing 20 as shown in figure 15. These dimples also create turbulent flow of the heated water further increasing heat transfer as is known to those familiar with this technology similar to a golf ball.
7. The invention provides the added protection from contaminating the refrigerant system with the heated fluid, by adopting the design and arrangement of parts to provide the pressure relief leak path 53 shown in figure 4. This “double wall” type seal will significantly increase the life of the heat pump and minimize the impact of a leak on the compressor and the heat pump system. Since the fluid seal breached will become clear by the loss of refrigerant or the presence of water around the heat exchanger, a breach will cause minimal disruption and make repair much less involved.
8. The invention makes repair of the heat exchanger as simple as possible and by using the isolation fittings 54 installed in a heat pump as shown in figure 1 allows repair or replacement of the heat exchanger invention without brazing or welding by simply unscrewing the fittings.
